

WasteRoutes

Regular Collections Management

Regular Mapping

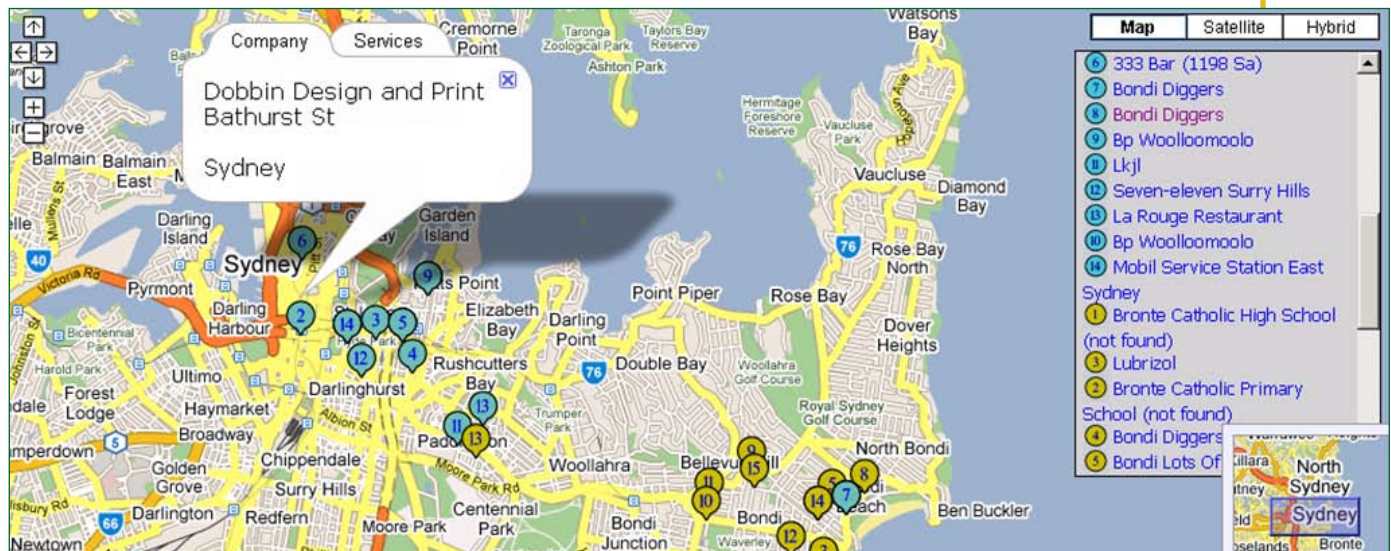

For Commercial / Industrial Waste or Resource Recovery Operations

Sometimes just seeing where your route collection points are on the map helps you realise where you should send sales reps to route-fill, or where outlying collection stops could be costing you more than you realise.

Day-of-service may not be all that important for some customers as long as it's one day a week. By plotting two routes in different colours, the jobs that should change days or routes stand out. This could simply mean selling larger or additional bins so that collection frequency could be reduced from twice a week to once a week. Wastedge helps you do more with less effort!

Add to this some Wastedge.com GPS tracking and you can see where your trucks really go and where they get held up at different points on the run. GPS trails also give you the data for automatic run summary (kms, hours, etc).

Wastedge.com gives you the edge by helping reduce run costs while increasing productivity and efficiency!
